Abstract: The quality of meat, particularly, has become a current problem. One of the main elements used in appraising meat quality is the percentage of lean meat from the total amount of carcass meat. This percentage has been measured by means of the German PG 200, FOM ULTRA checking device. This paper presents the results obtained at S.C. Suintest Avrig regarding the porcine that are bred there, as well as their compliance with the official system of appraising the quality of porcine carcass - the European system.
